

WASP from GWAVA - Anti-Virus protection for Novell® GroupWise™ WebAccess

The global nature of business today demands that information and communication are constantly available. Email, attachments and messaging are available through GroupWise WebAccess from any computer with web connectivity. Airport terminals, hotel business centers and client offices.

The problem is spam, viruses and illegal access coming through the back door of your GroupWise system. Because GroupWise WebAccess communicates directly with the Post Office, unsuspecting users can upload virus-infected attachments that bypass the perimeter defence at the GWIA, SMTP layers or even the MTA. WASP2 (WebAccess Server Protection) from GWAVA provides a complete solution to scan, filter and quarantine every element of your messaging system just like GWAVA 4 for GroupWise.

Only WASP2 sits at the GroupWise WebAccess Gateway filtering unwanted content before it reaches the system. WASP2 supports the same A/V engines as GWAVA 4 and includes direct integration with Kaspersky A/V scanner with each install.

Certain file formats like PIF and SCR, may be considered too high a risk to allow entrance to the system. Other file formats like AVI or JPG may be considered non-business related and not allowed access. The method for determining the files true nature (even if the extension has been changed) is called Finger-printing. This technology is unique to WASP2 and future proofs your investment as attacks become more sophisticated.

Security • Compliance • Disaster Recovery

Features

- ▶ WebAccess Server Protection
- ▶ Unique Virus protection
- ▶ Attachment blocking
- ▶ Fingerprinting technology
- ▶ Cross platform - NetWare, Linux and Windows (remotely)
- ▶ Leverage existing hardware
- ▶ Integrates with GWAVA UI
